holy island is a small island just off the west coast of anglesey north wales which is rich in archaeology of all periods between 2006 and 2010 archaeological excavations in advance of a major welsh government development site parc cybi enabled extensive study of the island s past over 20 hectares were investigated revealing a busy and complex archaeological landscape which could be seen evolving from the mesolithic period through to the present day major sites discovered include an early neolithic timber hall

aligned on an adjacent chambered tomb and an iron age settlement the development of which is traced by extensive dating and bayesian analysis a bronze age ceremonial complex along with the neolithic tomb defined the cultural landscape for subsequent periods a long cist cemetery of a type common on anglesey proved uncommonly to be late roman in date while elusive early medieval settlement was indicated by corn dryers this wealth of new information has revolutionised our understanding of how people have lived in and transformed the landscape of holy island many of the sites are also significant in a broader welsh context and inform the understanding of similar sites across britain and ireland

the focus of this book is to draw together still scattered data to chart and interpret the changing nature of life in towns from the late roman period through to the mid anglo saxon period did towns fail were these ruinous sites really neglected by early anglo saxon settlers and leaders

nitrogen is the most yield restraining nutrient in crop production globally efficient nitrogen management is one of the most important factor for improving nitrogen use efficiency field crops productivity and profitability efficient use of nitrogen for crop production is therefore very important for increasing grain yield maximizing economic return and minimizing nitrous oxide N_2O emission from the fields and nitrate NO_3 leaching to ground water integrated nitrogen management is a good strategy to improve plant growth increase yield and yield components grain quality and reduce environmental problems integrated nitrogen management combined use of chemical organic bio fertilizers in field crop production is more resilient to climate change

ceramic building material particularly roofing material is one of the most common finds on romano british sites yet despite its abundance it has been relatively little studied whole books have been devoted to relatively minor pottery types but it is extremely rare for a book to devote as much as a single chapter to ceramic roofing material this book is devoted to the study of ceramic roofing material primarily tegulae it considers how they

were made and develops and dates a typology it looks at the role of stamps and signatures and how these can inform the study of when and by whom the tegulae were made it analyses how the tiles were fitted onto pitched roofs how these roofs were constructed and proposes four stages in their evolution it suggests that tegulae might also have been used on some vaulted roofs finally the logistics costs and economics of tile manufacture and distribution are addressed the book follows a logical sequence considering first how tegulae were manufactured next their typology and then their dating in order to prepare the ground for the subsequent chapters on stamps and roof construction the final chapter brings all the evidence together to examine the economic and social data that can be derived from a study of tegulae grouped together as a single site in contrast where a useful assemblage of tiles has come from an individual site within a town this has been identified separately from other assemblages within the same town if these separate assemblages within the same towns are aggregated together then the number of individual sites falls from 104 to 85
